All the digits 14/02/2024
Romeo Lu and David Huang

	a	b	c	d
x				3
e	f	g	h	i

	8	2	6	7
				3
2	4	8	0	1

d cannot be 5 or 0 or 1
e can only be ~~0~~, 1, 2

d = ~~3~~ 4	d=6	d=7	d=8	d=9
i=2	i=8	i=1	i=4	i=7

i can only be 1, 2, 4, 7, 8

if e=1, d has to be 4 or 6
if e=2, d has to be 7, 8, 9
if d=4, a and b have to be 5 or 6 → but ~~d~~ cannot be ~~6~~ because of fig 1 and fig 2

	4	5	9	6
x				3
1	3	7	8	8

fig 1

if d=~~4~~, you can see that fig 3 is correct. 4x3=12 so i is 2. this means e is 1 and it is.

	5	4	9	6
x				3
1	6	4	8	8

fig 2

	5	6	9	4
x				3
1	7	0	8	2

fig 3

idea 1: d has to be odd (7, 9)
i will have to be (1, 7)
e ≠ 1
(come back)
(wrong)

After looking at if d=6, we can look at if d=4. If so, 4x3=12. That means that e cannot be 2 anymore, becoming a 1. If e is 1, a could only be 5 (1 will be used, 2 has already been used, 3 is out of bounds and 4 has already been used). Now that we've gotten 4 and 5, we need the last consecutive number which is 6 (not 3). that means the last number is 9 as the other sums were 2 digits. Nine is in c, and four is in d. This means the number is 5694.
